SaaS

Rent your apps !

« Software as a Services »
(SaaS) solutions are programs that can be accessed via the Internet and include all associated services.

PRODUCT FEATURES

« Software as Services » (SaaS) solutions are programs that can be accessed via the Internet. Rather than installing an application on your computer or your local server, use the applications on our servers. This solution guarantees reliable access to your data, allowing you to avoid common issues such as incompatibility or maintenance fees that are hard to control. The major benefit of this solution is that it allows you to access your data wherever you are. The fact that you do not need to install anything on your PC bypasses any issues relating to compatibility, updates, backups or computer crashes.

Ideal for a multi-site configuration:

Since the SaaS service is accessible via an Internet connection, you can use it from your headquarters, your agencies, while on the move with your laptop, from your home with your personal computer, in other words from any computer connected to the Internet. This flexibility enables you to communicate and share information with your staff quickly, easily and without any constraints and without having to set up a complex and costly system.

The Win€ur product line:

Win€ur Accounting - Win€ur AP/AR - Win€ur Analytic - Win€ur Budgets - Win€ur Consolidation - Win€ur Fixed Assets - Win€ur Portfolio - Win€ur First - Win€ur Payroll - Win€ur Invoicing - Win€ur Invoicing & Stocks - Win€ur Time Sheet.

HIGHT LEVEL OF SECURITY:

Security and protection of IT systems are currently a hot topic. IT incidents are growing in number and severity. To ensure uninterrupted service and optimal protection of your data we have set up a very high level of security. You are relieved of this concern and can fully devote your time to your core business without having to worry about

maintenance issues related to your IT systems. Thanks to the SaaS approach real security becomes accessible for all types of companies, even if they do not have any aptitude for IT. The SaaS provider has firewall mechanisms, intrusion detectors, authentication systems to verify access for each user according to their profile as well as backup systems for data and redundant servers. In addition, the latest encryption technology is used to guarantee the protection of sensitive data during their transfer onto the network. The infrastructures themselves are physically protected by access control systems, anti-fire and anti-flooding installations.

RENT:

No need to buy software, yet still have access to the latest version. Stop the rat race for the glory of hardware. Access company applications from home or on the train. Buy accounting, reporting or payroll programs like you would rent a television with an all-inclusive service. All this is now possible on the WEB thanks to SaaS.

SaaS apps are services that remain accessible 24/7, from any location whether office, construction site, home or on a trip, from anywhere in the world.

Subscribing to a SaaS offer is the same as renting apps that are online through a provider.

Applications are provided ready to run without any deployment, maintenance or update constraints. So the company can take advantage of the software, via the WEB, for a simple monthly fee.

The SaaS model simplifies things for a business just by renting a service.

FINANCIAL BENEFITS

The financial benefits compared to traditional IT solutions are not the only aspect to be considered. As with all outsourcing, the company always wins when concentrating on their core business. Furthermore, in terms of accounting, a large part of systems costs becomes a variable cost just like other rentals or services and is no longer a fixed cost with depreciation.

RESOURCES

The client only needs a bit of power at their own work station and can thus use their current, even old, IT system. The benefits are more than obvious for smaller structures that do not have sufficient internal IT resources and for which the time spent backing up data, updating information or software is always too much.

QUALITY

The service provider adheres to a technical charter and service quality contract. The SLA or Service Level Agreement is a guarantee of quality of service, a document that formalizes the technical level of quality which the service provider agrees to. This agreement specifies the availability of apps, user conditions are well as confidentiality agreements and the possibilities of cancelling the service.

SaaS solutions:
obvious benefits for the business.

- Mobility, Accessibility
- Financial benefits
- Exchanges, Services
- Updates
- Automatic updates

Available services
